**EVER GROWING RESIDENCES**

**Concept:** Sustainable construction. What does it mean? It is not a building or plan designed with large amounts of greenland, but an organization just like a tree or a natural thing based really on people’s needs which relate the nature and human being. It never changes greatly, but it ever grows.

**Designer:** Jianwan Xu, college of architecture and urban planning at the, Tongji University, China.
**Tutor:** Zhenyu Li. Email: angenxjw@etang.com

**The analysis of the present situations**

1. **Situation of our residences**
   
   We can see the residences which does not base on the people’s needs but control the feelings of the people. It is an unfantastic and boring space.

2. **The vivid spaces of the traditional residences**
   
   The traditional residence is just like a tree which always grows. It bases on the people’s needs and their custom. It obeys a kind of natural order and people develops it instinctly.

---

**The logic of the architecture based on sustainable construction**

1. **The order of the growth**
   
   the growth of the natural things always obey a kind of natural order.
   
   The order of the main branch is similar to the order of the leaves. Everything in the nature all has a basic layers of the orders. It is a contradiction between the order and the confusion.

---

**The production of the form:**

Now the building can grow just like a tree and it changes with the people’s different choises. The void part can be the greenland in the building which can improve the surroundings. There has a four metres level in every nine level in the building which can supply the spaces for the residences to have a rest and breathe freely. So a sustainable construction should be an organizasim.
